

Beam for Real-time Manufacturing Data Analysis

Jeswanth Yadagani - Oden Technologies

Jeswanth Yadagani

ML Engineer
Oden Technologies

Outline of this talk

- Oden and its customers
- Second bullet goes here
- Slide No. 10
- Fourth point is very important
- Fifth one is a secret! Don't share
- blah blah blah.....
- This is an application of the third point
- The animations and flow charts
- Beam it is!
- Classic THANK YOU slide

Outline of this talk

```
“ns=2;s=MQTT.Line3BlendingPLC.Line  
3 Blending

```

```
“Bad process conditions  
observed on Line 2”
```

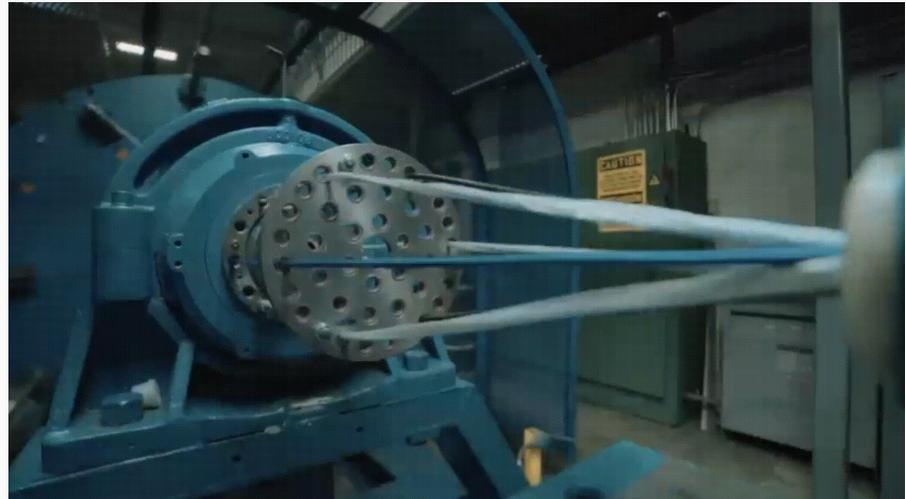

Oden Technologies

Oden's Customers

Medium to Large scale
industries manufacturing wires
& cables, pipes, chemical resins,
paper and pulp

Our Product - Live Data and Alerting

- Metrics Streaming at a second resolution
- Real-time status indication of the process
- Real-time intelligent alerts

Product State

ALERT

Downtime violation on Line 1

As of 12:55pm, Line 1 has been in Downtime for more than 15 minutes.

[View line](#)

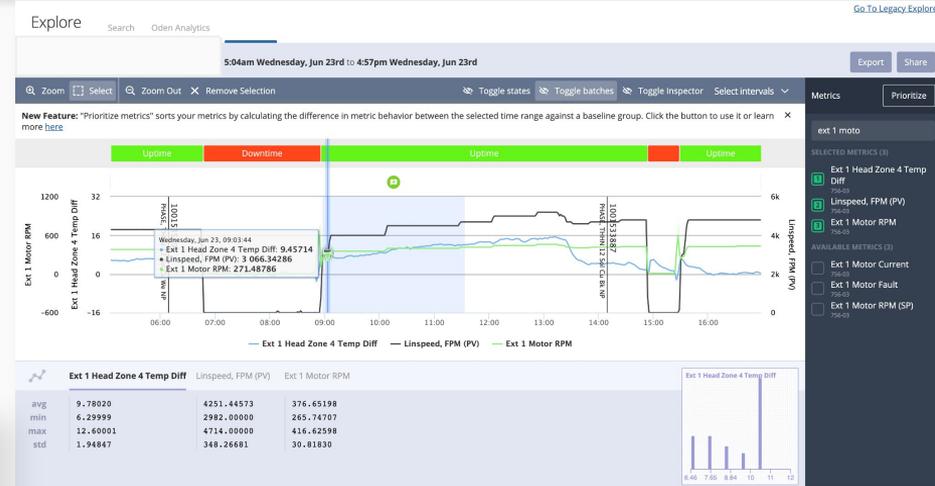

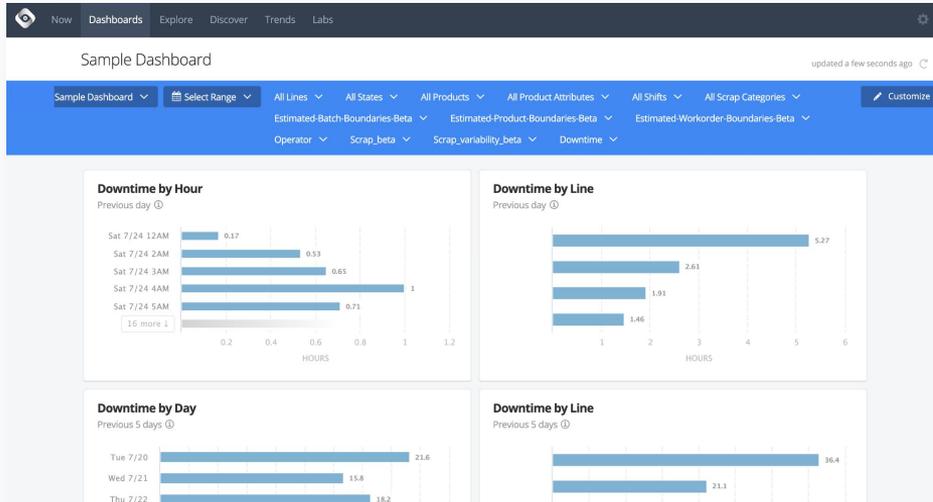

Snooze this alert for: [30m](#) [2h](#) [8h](#) [24h](#)

Powered by Oden Technologies
Is this alert useful? [Let us know!](#)

The alert notification is a white card with a green header and footer. It features a green diamond icon with a white 'D' inside. The main text is in bold black font. There is a green button with white text 'View line'. The footer contains a link to 'Let us know!'.

Our Product - Historic Analytics

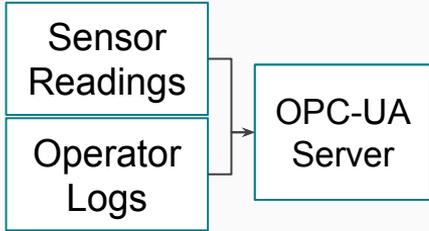

- Centralize and compare metrics for root cause analysis.
- Custom dashboards indicating performance indexes of interest for comparison.

Cloud IoT
Core

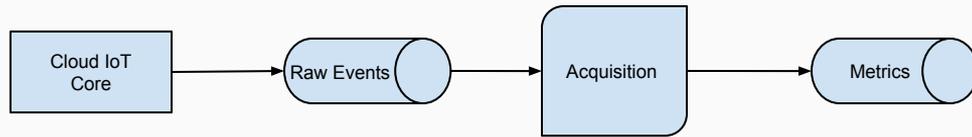

THE LOOPS

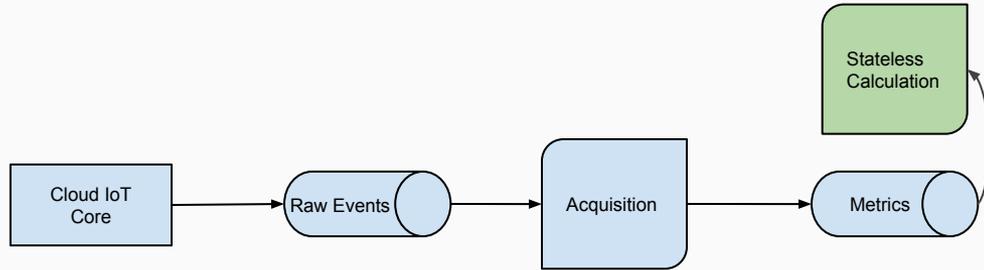

THE LOOPS

THE LOOPS

THE LOOPS

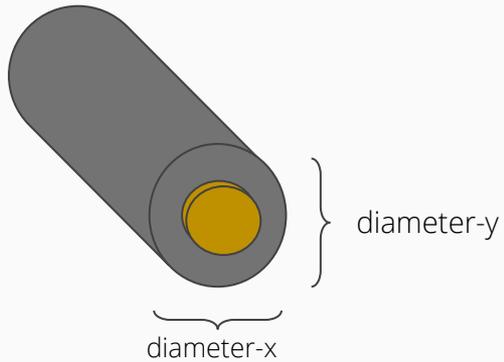

Operations on the data that is streaming in the present moment

Stateless Calculation

diameter_x

diameter_y

Raw streams: diameter-x and diameter-y

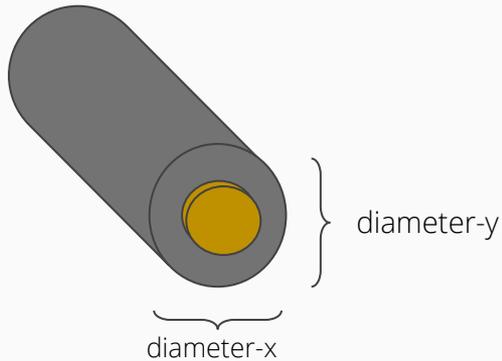

Stateless Calculation

diameter_x

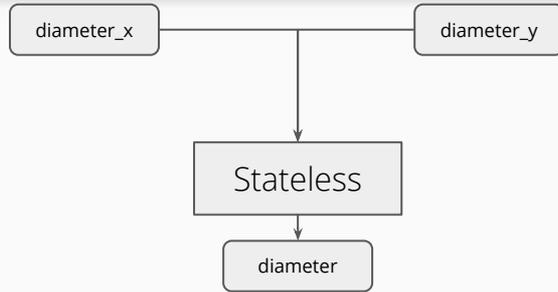

diameter_y

Raw streams: diameter-x and diameter-y

User Requirement: What is the diameter of cable that is being produced?

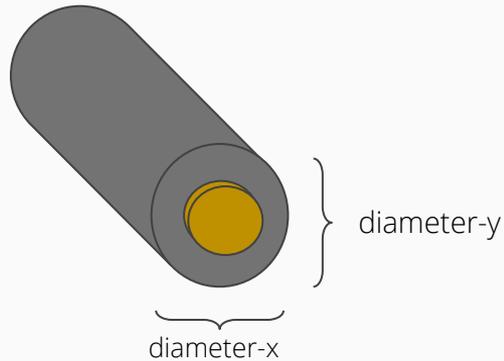

Stateless Calculation

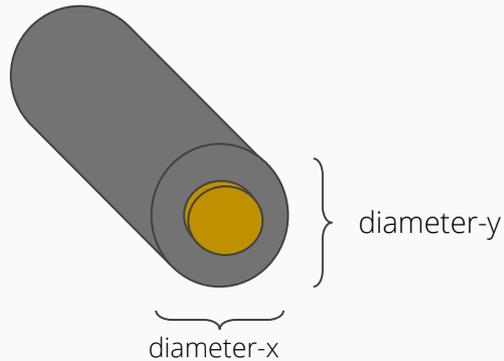

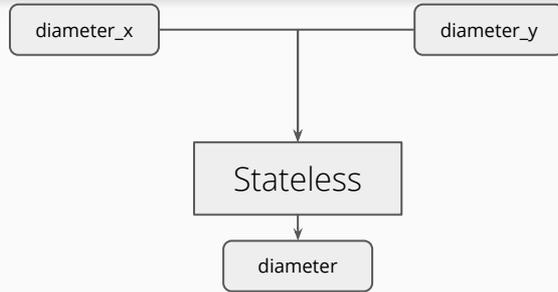

Raw streams: diameter-x and diameter-y

User Requirement: What is the diameter of cable that is being produced?

```
diameter = Stateless(diameter-x,  
                    diameter-y,  
                    function = mean)
```

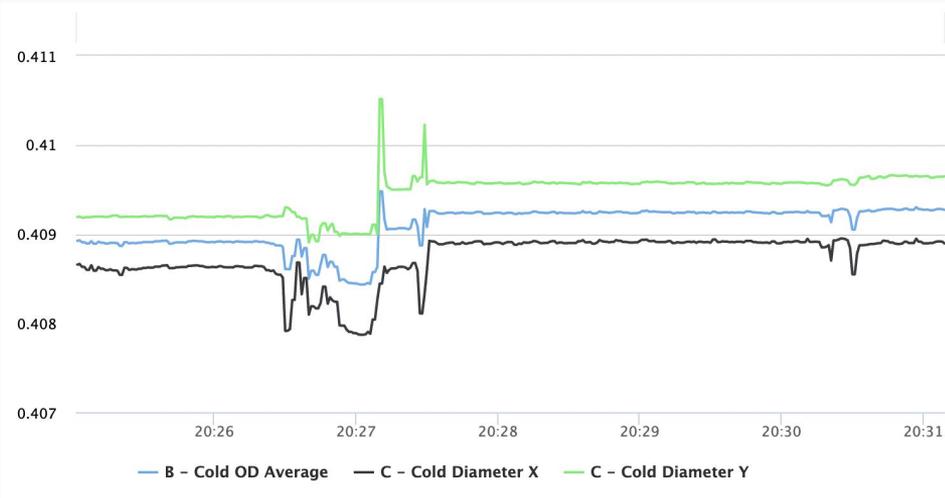

Stateless Calculation

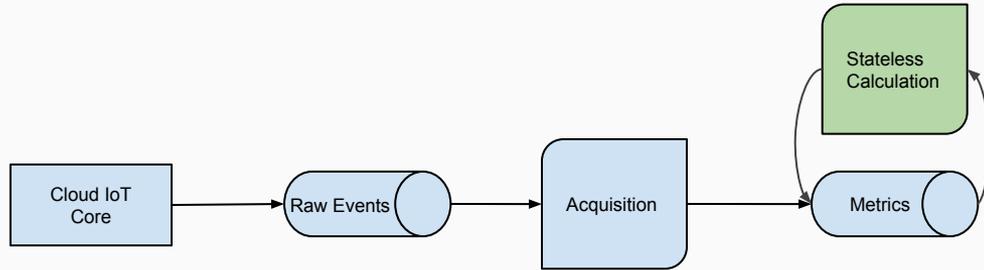

Raw streams: diameter-x and diameter-y

User Requirement: What is the diameter of cable that is being produced?

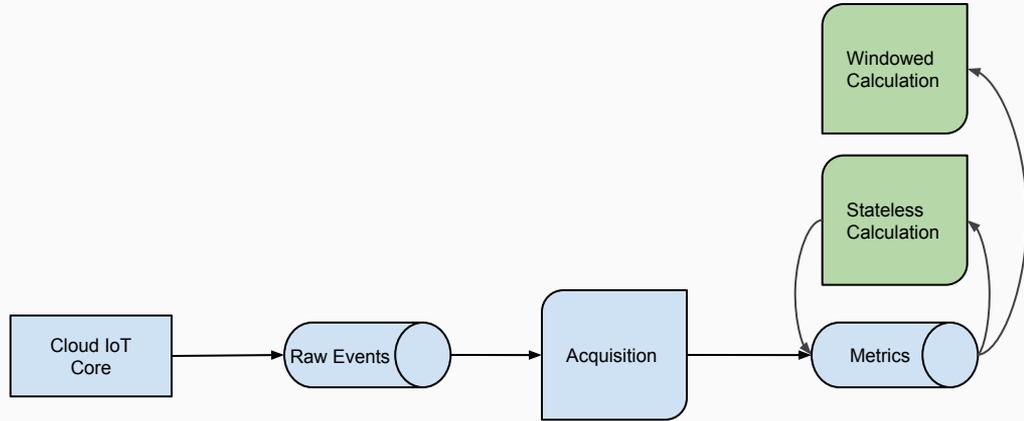

```
diameter = Stateless(diameter-x,  
                    diameter-y,  
                    function = mean)
```

THE LOOPS

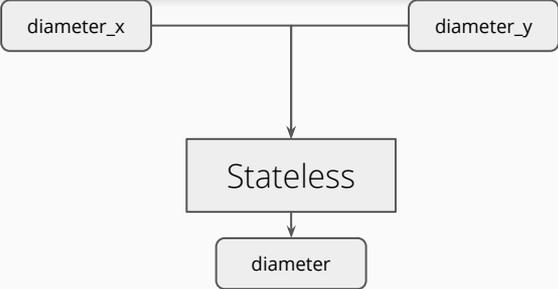

THE LOOPS

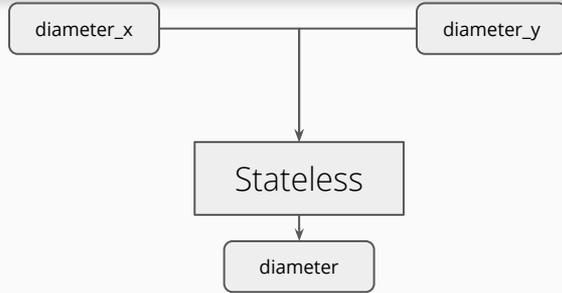

Operations on the data that is gathered into a window of predefined size

Windowed Calculation

Raw streams: diameter-x and diameter-y
Specifications: diameter-USL and diameter-LSL

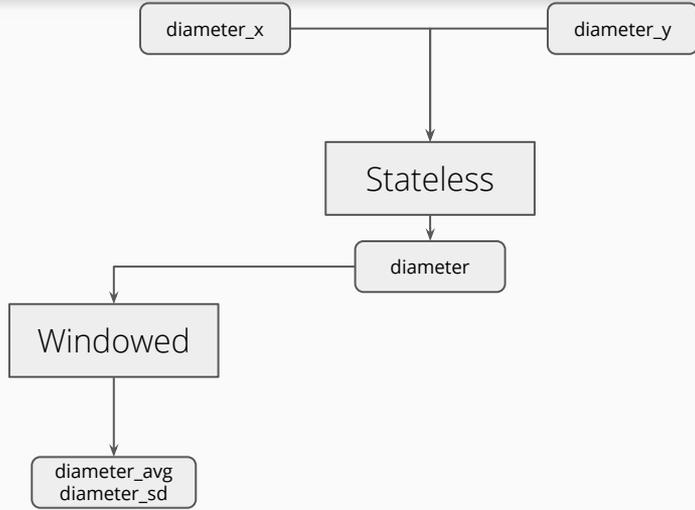

Windowed Calculation

Raw streams: diameter-x and diameter-y
Specifications: diameter-USL and diameter-LSL

User Requirement: Is diameter under specification limits?

Windowed Calculation

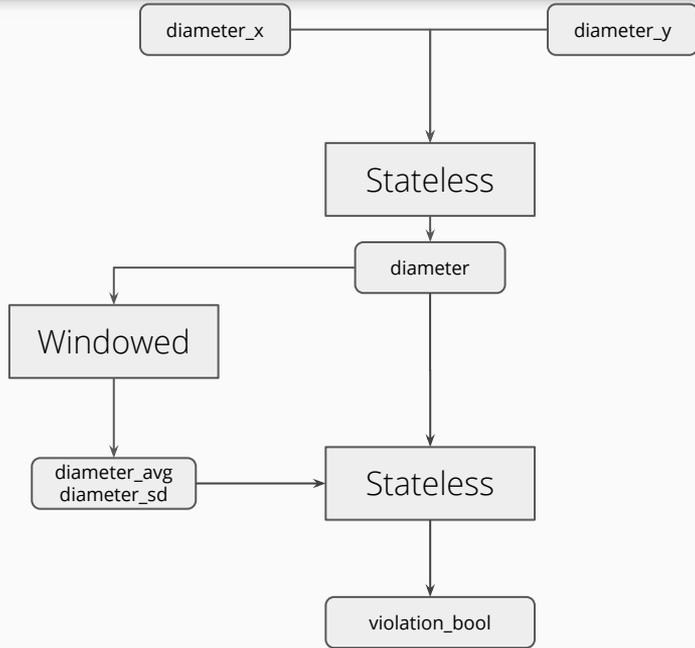

Raw streams: diameter-x and diameter-y
Specifications: diameter-USL and diameter-LSL

User Requirement: Is diameter under specification limits?

diameter_avg, diameter_sd = Window(diameter,
functions = [avg, sd],
size = 60s,
slide = 5s)

Windowed Calculation

Raw streams: diameter-x and diameter-y
Specifications: diameter-USL and diameter-LSL

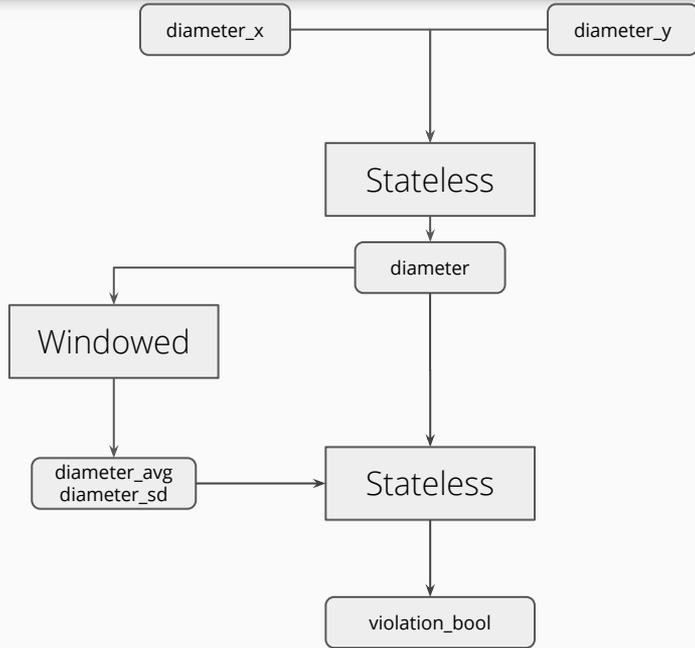

User Requirement: Is diameter under specification limits?

diameter_avg, diameter_sd = Window(diameter,
functions = [avg, sd],
size = 60s,
slide = 5s)

limit_bool = diameter-USL > diameter_avg > diameter-LSL

stability_bool = diameter_avg - 3*diameter_sd > diameter >
diameter_avg + 3*diameter_sd

Windowed Calculation

Raw streams: diameter-x and diameter-y
Specifications: diameter-USL and diameter-LSL

User Requirement: Is diameter under specification limits?

diameter_avg, diameter_sd = Window(diameter,
functions = [avg, sd],
size = 60s,
slide = 5s)

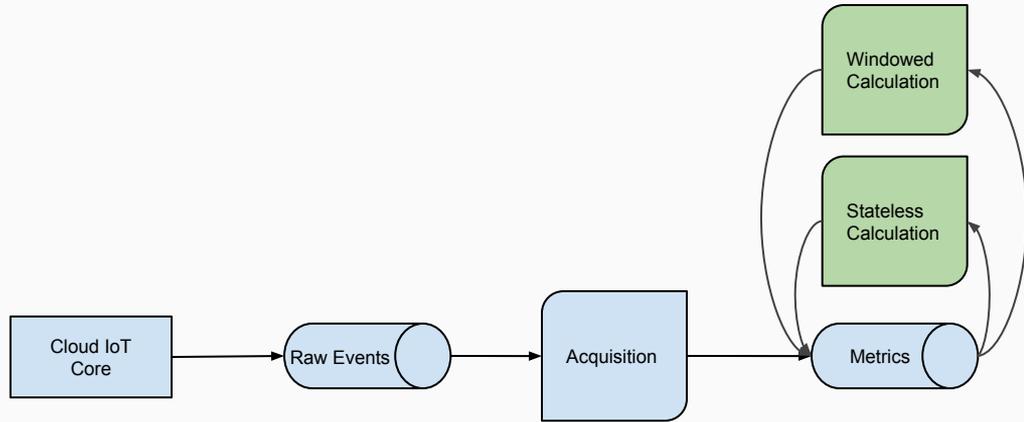

limit_bool = diameter-USL > diameter_avg > diameter-LSL

stability_bool = diameter_avg - 3*diameter_sd > diameter >
diameter_avg + 3*diameter_sd

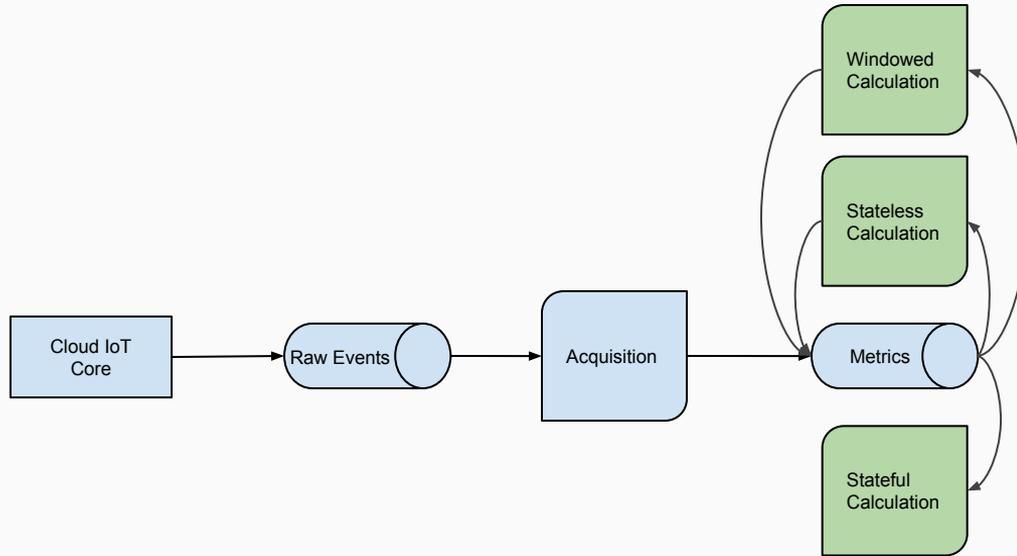

violation_bool = ~(limit_bool AND stability_bool)

This stream tells
us if diameter is
off specs

THE LOOPS

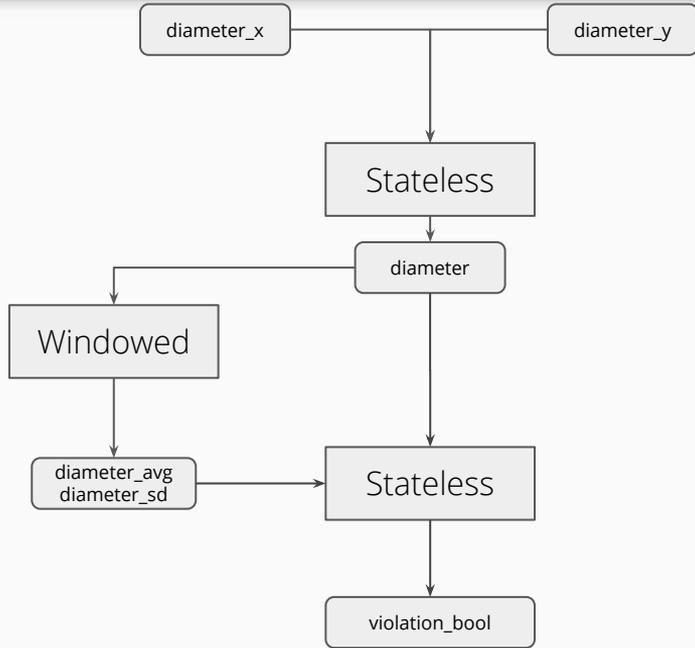

THE LOOPS

Operations that leverage advantages of maintaining memory and are custom reset upto certain events of interest

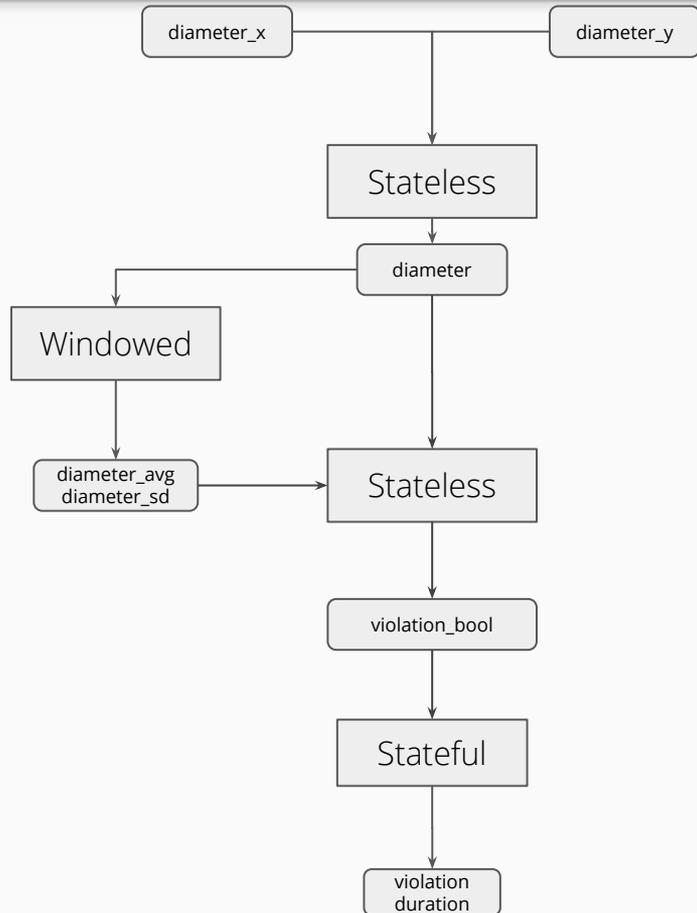

Stateful Calculation

Raw streams: diameter-x, diameter-y and **linespeed**
Specifications: diameter-USL and diameter-LSL

User Requirement: How much of the cable is off specs in this batch?

Stateful Calculation

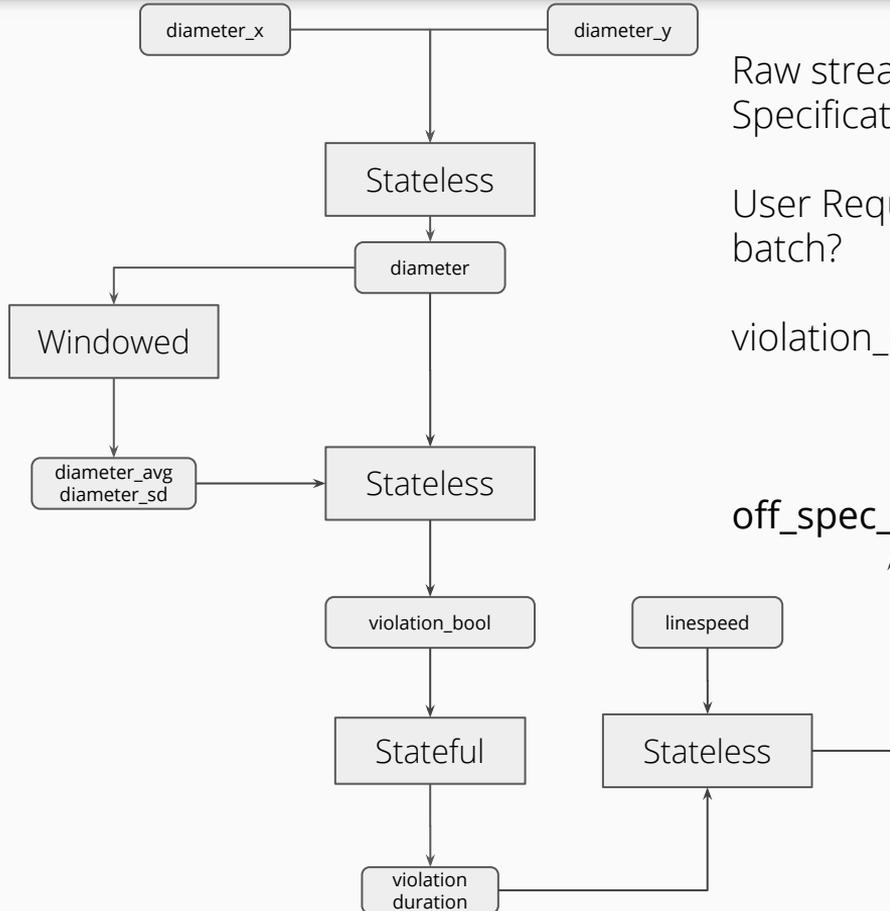

Raw streams: diameter-x, diameter-y and **linespeed**
Specifications: diameter-USL and diameter-LSL

User Requirement: How much of the cable is off specs in this batch?

```
violation_duration = Stateful(violation_bool,  
                             function = time_aggregate,  
                             reset_on = new batch)
```

Stateful Calculation

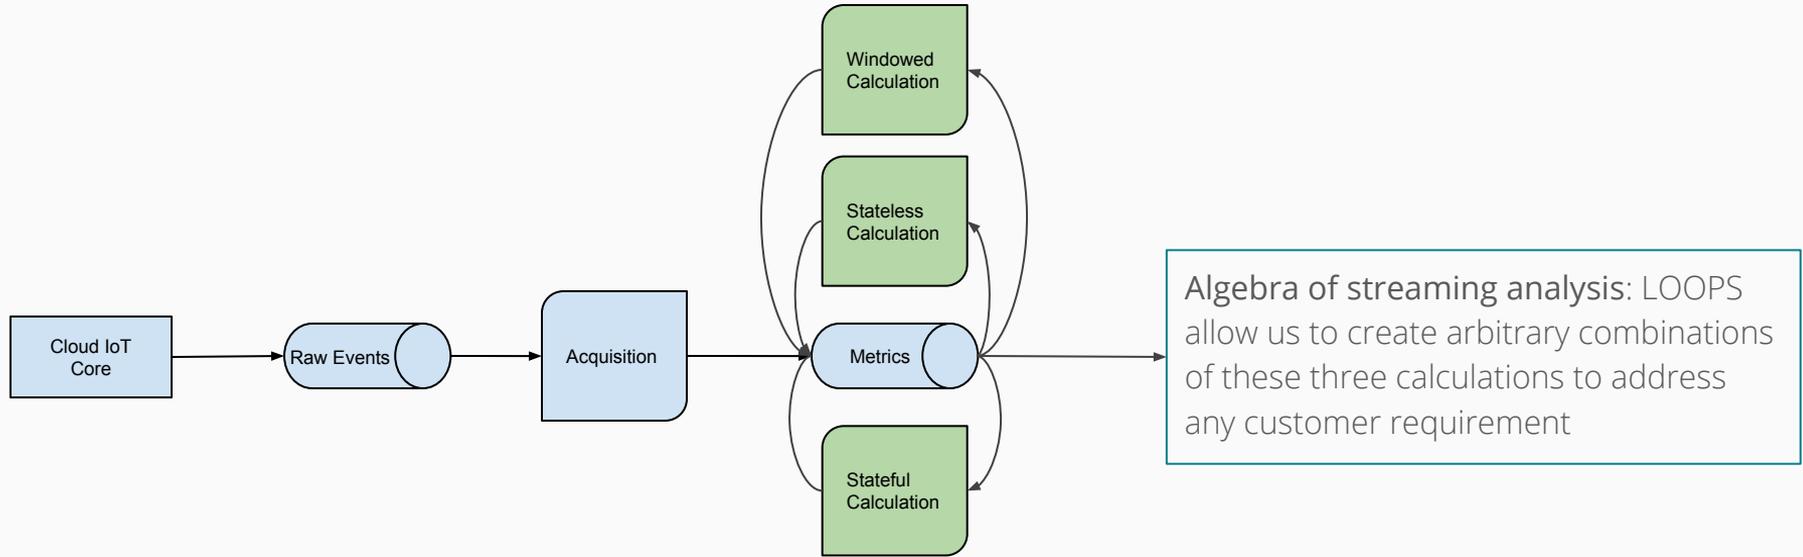

Raw streams: diameter-x, diameter-y and **linespeed**
Specifications: diameter-USL and diameter-LSL

User Requirement: How much of the cable is off specs in this batch?

`violation_duration = Stateful(violation_bool,
function = time_aggregate,
reset_on = new batch)`

`off_spec_cable = Stateless(linespeed, violation_duration
function = multiply)`

Alerting on Bad Process Conditions

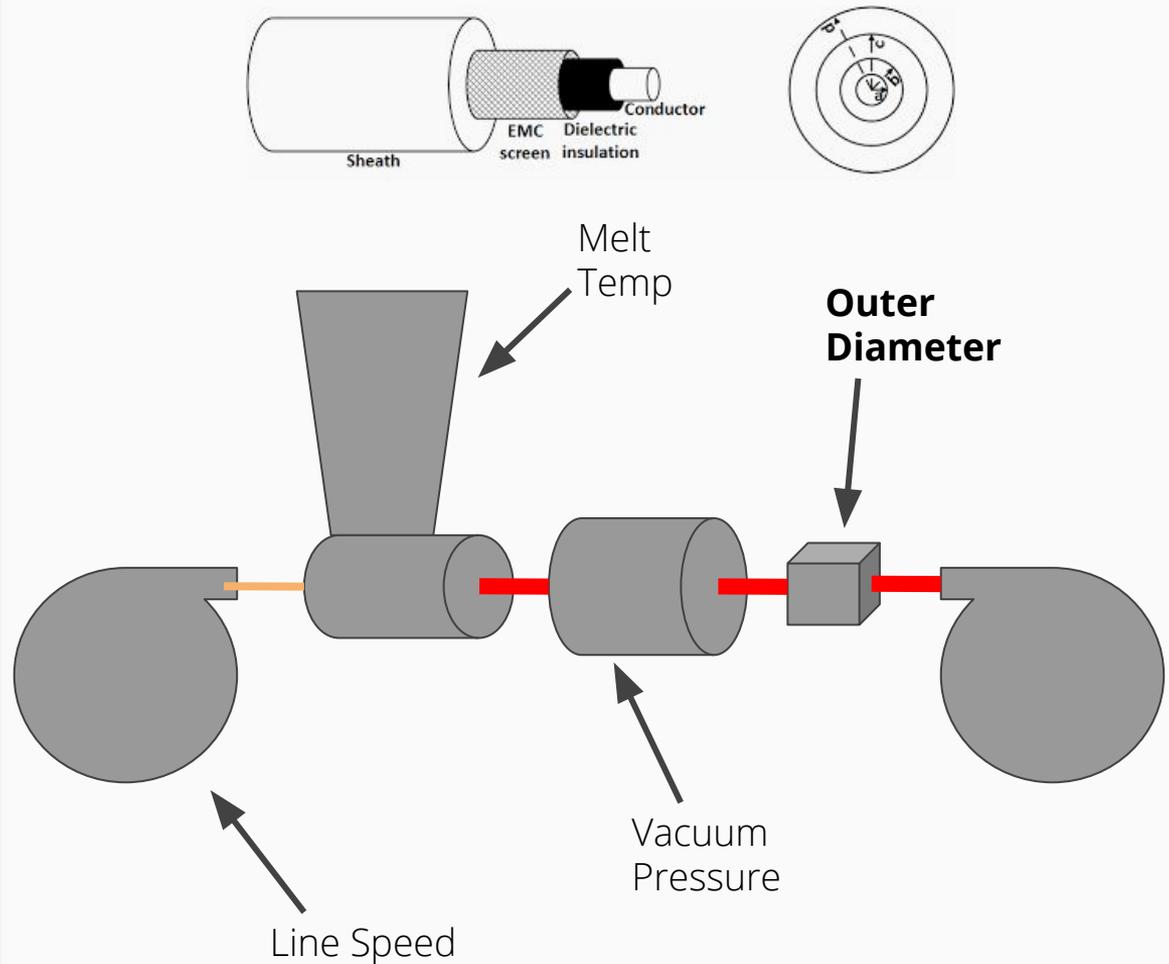

Cable Manufacturing

- Copper is pulled from an in-spool into an extruder.
- Plastic is melted over the copper to make wire.
- Wire is cooled.
- Wire is pulled into an out-spool.

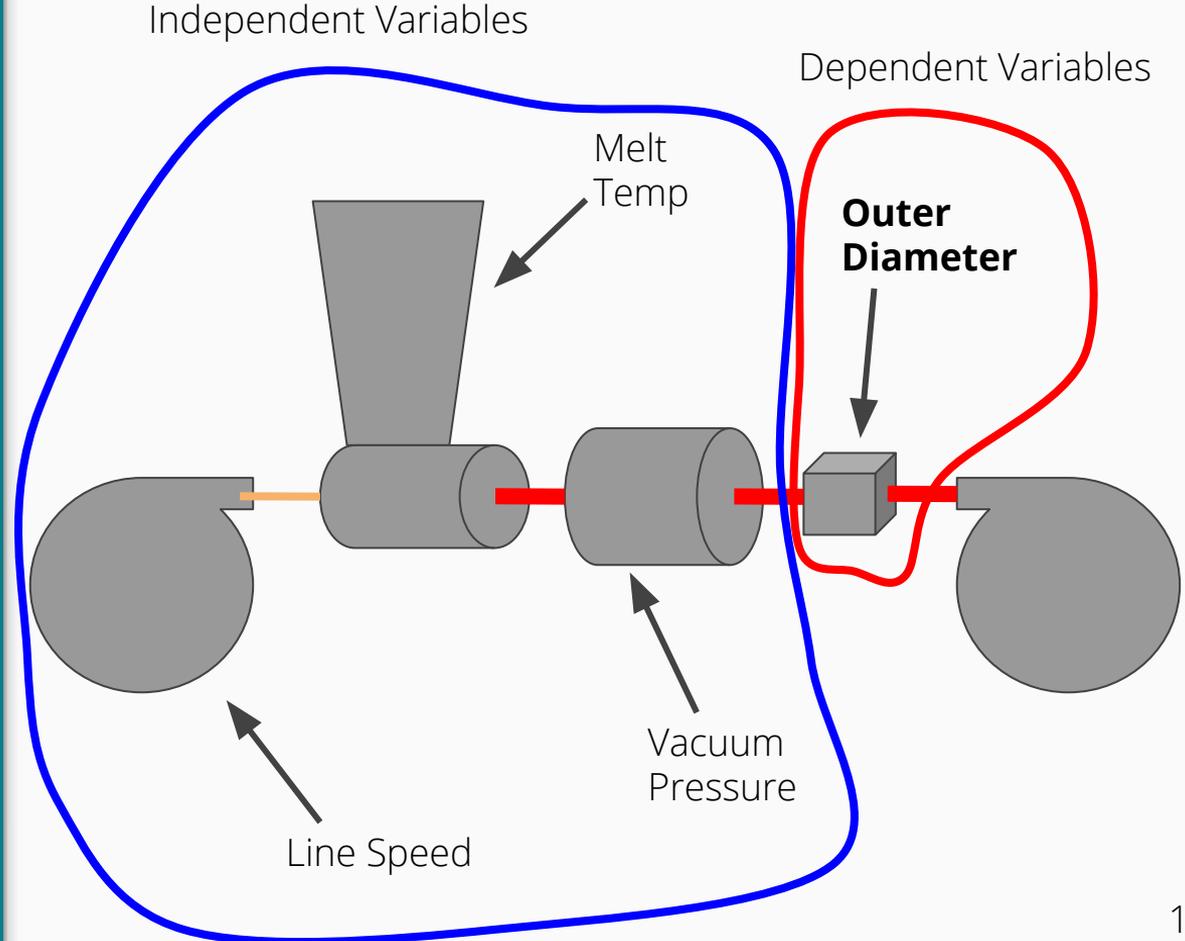

Cable Manufacturing

- Copper is pulled from an in-spool into an extruder.
 - Plastic is melted over the copper to make wire.
 - Wire is cooled.
 - Wire is pulled into an out-spool.
-
- A laser measures the diameter of the wire to monitor its closeness to spec.

Process Alerts with streaming pipeline

Decision trees are trained on historic data to extract rules corresponding to bad and good production.

Process Alerts with streaming pipeline

Decision trees are trained on historic data to extract rules corresponding to bad and good production.

Combination:

mean(Melt Temp) \geq 800F

AND min(Vacuum Pressure) $<$ 4Pa

AND Time since run start $>$ 15 min

Of the 84 segments 100.0% lead to bad production quality

Process Alerts with streaming pipeline

Decision trees are trained on historic data to extract rules corresponding to bad and good production.

```
S1 =  
Window(melt_temperature,  
function = mean,  
size = 300s,  
slide = 60s)
```

Combination:

mean(Melt Temp) >= 800F

AND min(Vacuum Pressure) < 4Pa

AND Time since run start > 15 min

Of the 84 segments 100.0% lead to bad production quality

Process Alerts with streaming pipeline

Decision trees are trained on historic data to extract rules corresponding to bad and good production.

S1 =
Window(melt_temperature,
function = mean,
size = 300s,
slide = 60s)

S2 =
Window(vacuum_pressure,
function = min,
size = 300s,
slide = 60s)

Combination:

mean(Melt Temp) >= 800F

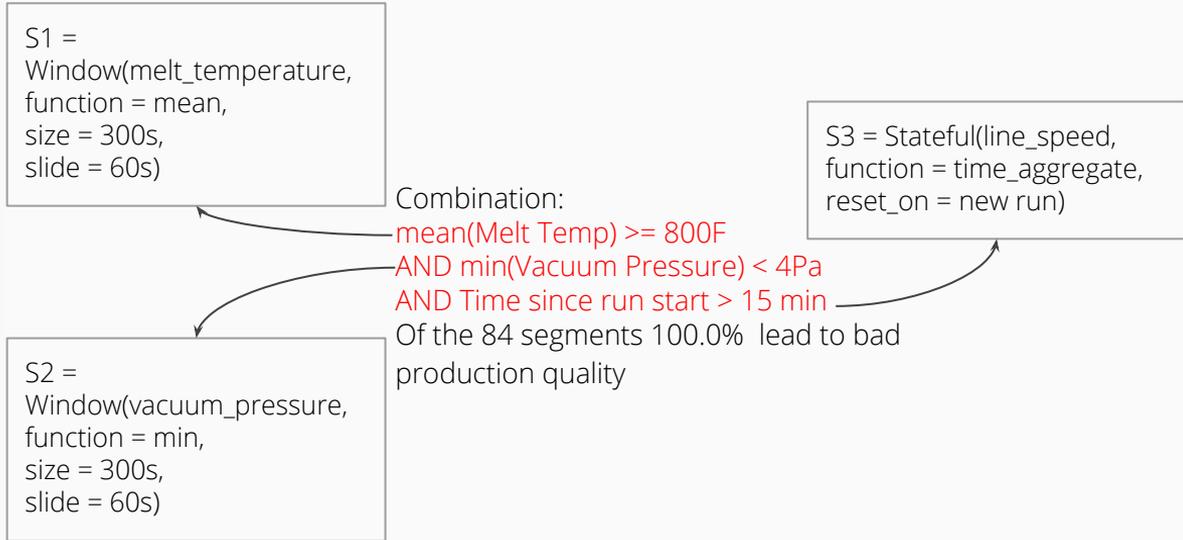

AND min(Vacuum Pressure) < 4Pa

AND Time since run start > 15 min

Of the 84 segments 100.0% lead to bad production quality

Process Alerts with streaming pipeline

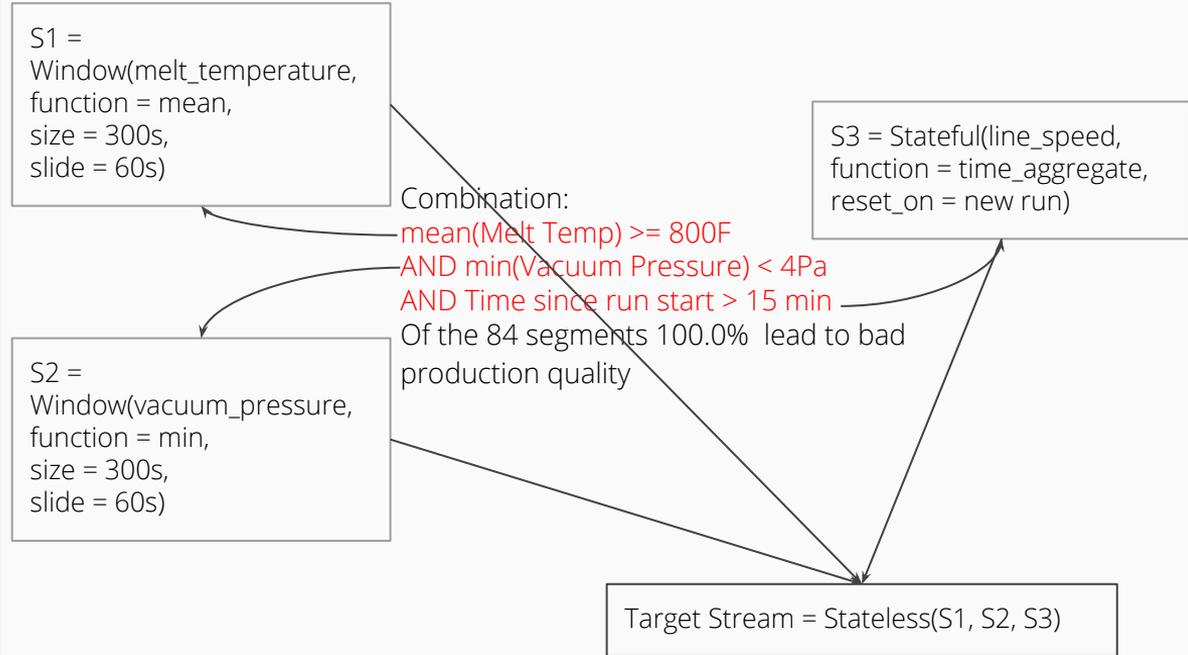

Decision trees are trained on historic data to extract rules corresponding to bad and good production.

Process Alerts with streaming pipeline

Decision trees are trained on historic data to extract rules corresponding to bad and good production.

Alerts are configured to notify operators on factory floor when process goes into bad production conditions.

Alert!!!

Oden Alerts <alerts@oden.io>
to me ▾

6:09 PM (1 hour ago)

ALERT

Outer Diameter violation on Line 2

As of 6:09pm EDT, Outer Diameter on Line 2 is in bad process conditions for at least 5 minutes

[View line](#)

Snooze this alert for: [30m](#) [2h](#) [8h](#) [24h](#)
